(OVR)

# EMRA: Extreme weather Monitoring and Risk assessment system

- Aim: development of an extreme weather monitoring and risk assessment system to design a decision support tool to manage weather risks in agriculture
- Duration: 02/2017-04/2020
- Budget: 1.4 Mio. €
- Project team:

Deutscher Wetterdienst  
Wetter und Klima aus einer Hand

- Project holder: Bundesanstalt für Landwirtschaft und Ernährung

With support from

ptble  
Projekträger Bundesanstalt  
für Landwirtschaft und Ernährung

by decision of the  
German Bundestag

# Motivation

- Systematic recording of extreme weather related damage in agriculture
- Contribution to close data and knowledge gaps (mid and longterm)
- Supply practice-oriented decision supports
- Development and implementation of webtools/ an APP (EMRA)
- Methods to quantify extreme weather risks
  - Past & present: historic (weather-)data & weather forecasts
  - Future: Climate projections, decadic climate prediction

Monitoring-app    Decision support tool

# Concept

## Risk Assessment System

Designing an **interactive Information Exchange**

- System infrastructure
- Analysis routine
- Data integration

## Extreme Weather Monitoring

Recording of **data on field scale**:

- Frequency
- Exposure
- Damage

**...incl. metadata**

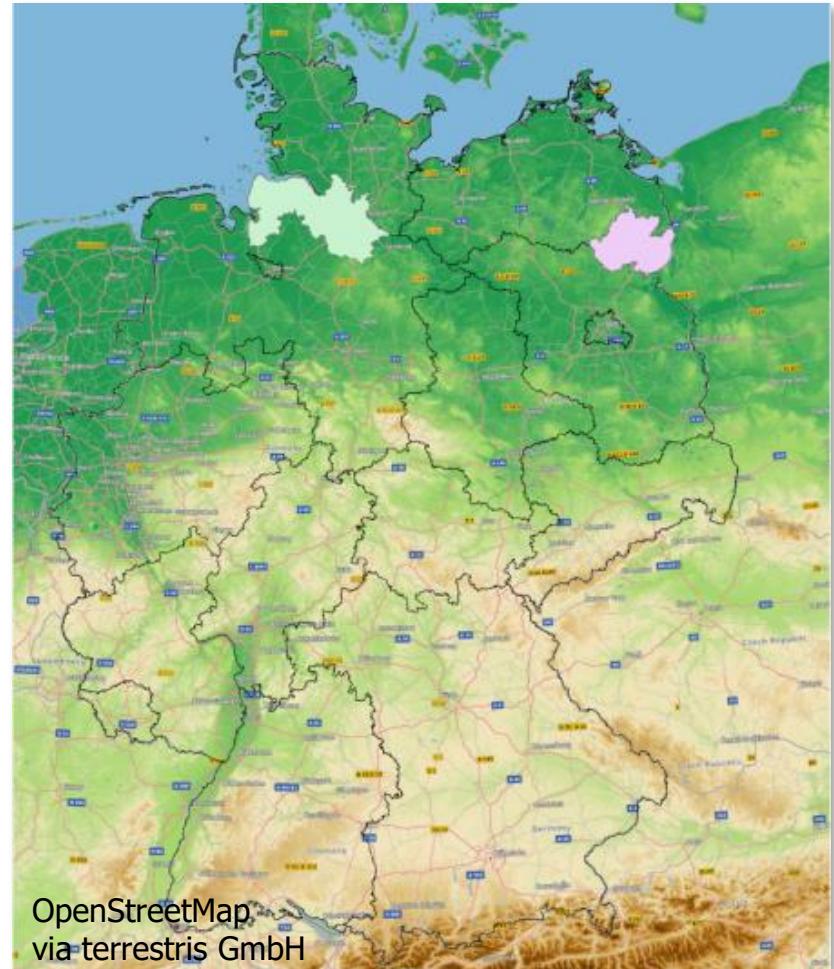

## Decision Support

Providing **local and crop-specific information**

- Risk/Exposure (current and historic)
- Maps, graphs, indices and thresholds
- spacial-temporal dynamic

# Stakeholder Involvement

- Test crops and regions
  - „Apple in the Altes Land“
  - „Winter wheat in the Uckermark“
- User involvement:
  - Integration of agricultural consultants and test farms
  - Nationwide online survey for farmers (30.01. - 31.12.2018) on risk (damage suffered, damage potential, measures taken) and need for advice
  - Advisory board

# Relevant Extreme Weather Events

## Online survey

Ranking of extreme weather events, that induced loss in crop yield and quality

### Cropping farms\* (n=143)

Rank	1	2	3	4	5	6	7	8	9
Extremes	drought	heat	heavy rain	hail	continual rain	spring frost	winter frost	storm	early frost
Ø rank	2,2	3,5	3,8	4,4	4,6	5,2	5,3	5,6	7,6
St. dev	1,8	2,1	1,9	2,4	2,6	2,0	2,5	2,2	1,6
n	134	117	115	119	111	109	106	101	89

### Fruit growing farms\* (n=54)

Rank	1	2	3	4	5	6	7
Extremes	hail	spring frost	continual rain	storm	heat	drought	heavy rain
Ø rank	2,2	2,7	4,3	4,3	4,5	5,1	5,1
St. dev	1,7	1,9	2,2	2,3	2,3	2,1	2,0
n	45	43	39	36	38	34	33

\* All farms with exclusively cropping or fruit growing, survey period: 30.01.-14.08.2018

# Extreme weather in agriculture...

May result in...

- Hail ([hail damage](#))
- Continual rain ([waterlogging](#))
- Heavy rain ([erosion](#))
- Storm ([wind damage](#))
- Drought ([drought damage](#))
- Heat / Solar radiation ([apple sun burn](#))
- Frost ([winter killing](#))

# Hail

# Water logging

# Frost (-blanketing)

# Extreme weather in agriculture...

May result in...

- Hail ([hail damage](#))
- Continual rain ([waterlogging](#))
- Heavy rain ([erosion](#))
- Storm ([wind damage](#))
- Drought ([drought damage](#))
- Heat / Solar radiation ([apple sun burn](#))
- Frost ([winter damage](#))

And depends on ...

- Intensity/strength of weather (Min T, Max T, PDSum, ...)
- crop/variety
- Phenological phase (~time)
- Cultivation system
- Local factors (soil, topography, etc.)

## Decision Support Tools

Weather data

Temp. (Min Max,...)  
Precip. (sum, intens.)  
...

Phenological phase

Agricultural indicators

Field capacity  
Evapotranspiration  
...

Geodata

Soil type  
Erodability  
Slope  
...

Damage monitoring

Historic damages  
Damage potential

Decision support tools

- field-specific → smallest possible scale
- crop-specific → thresholds
- customizable → cultivation system, variety, thresholds, period
- comparative → field vs. farm or region

User

Cultivation System  
Crop/Variety

Show:

- historic damage
- Current weather and forecasts
- Indicators, maps, Graphs, thresholds
- Management recommendations

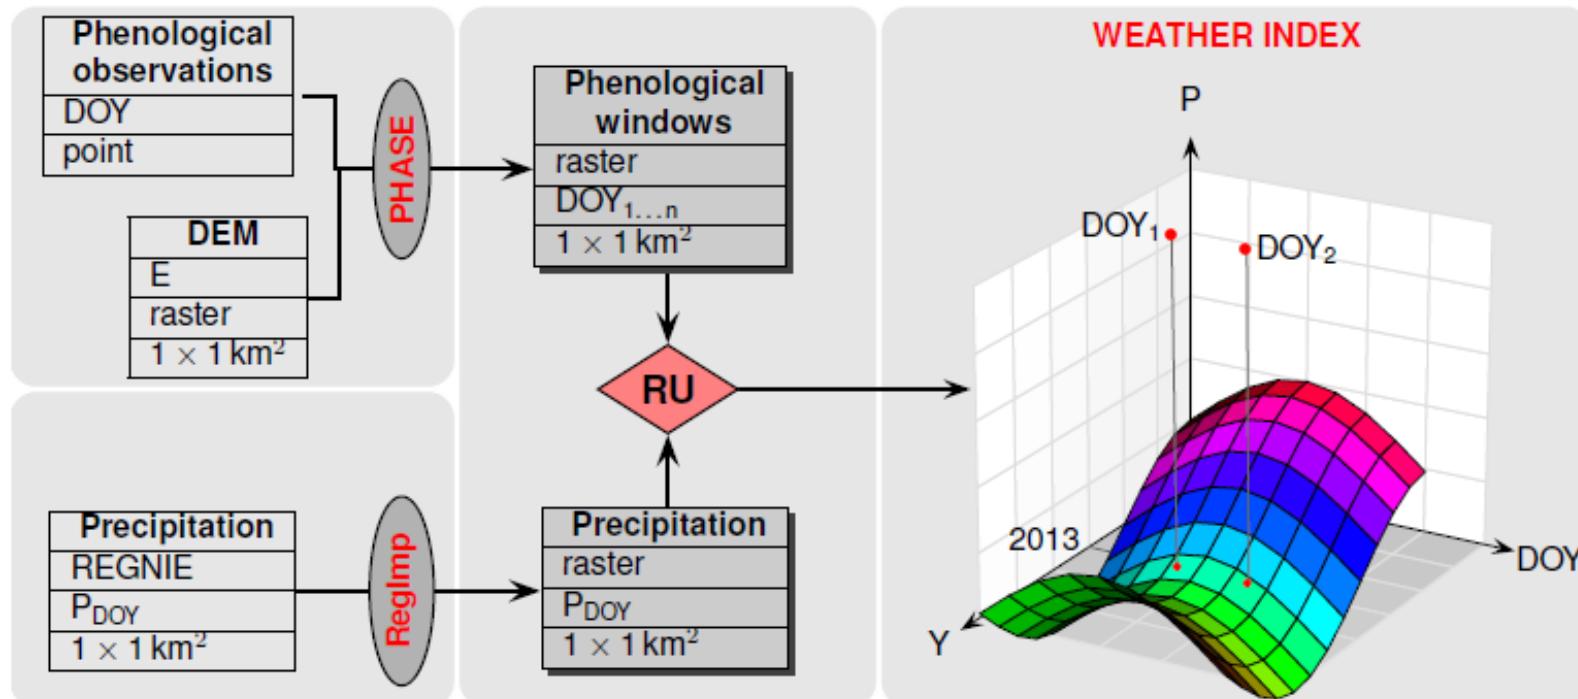

Support decisions on:

- long-term risks
  - Hail nets, frost-protection, irrigation
- mid-term risks
  - Choice of crop/Variety, plowing
- acute measures
  - Erosion breaks

# Decision Support Tool

## Phenologic phase-specific dynamic indices

Flow chart for dynamic modeling of weather indices

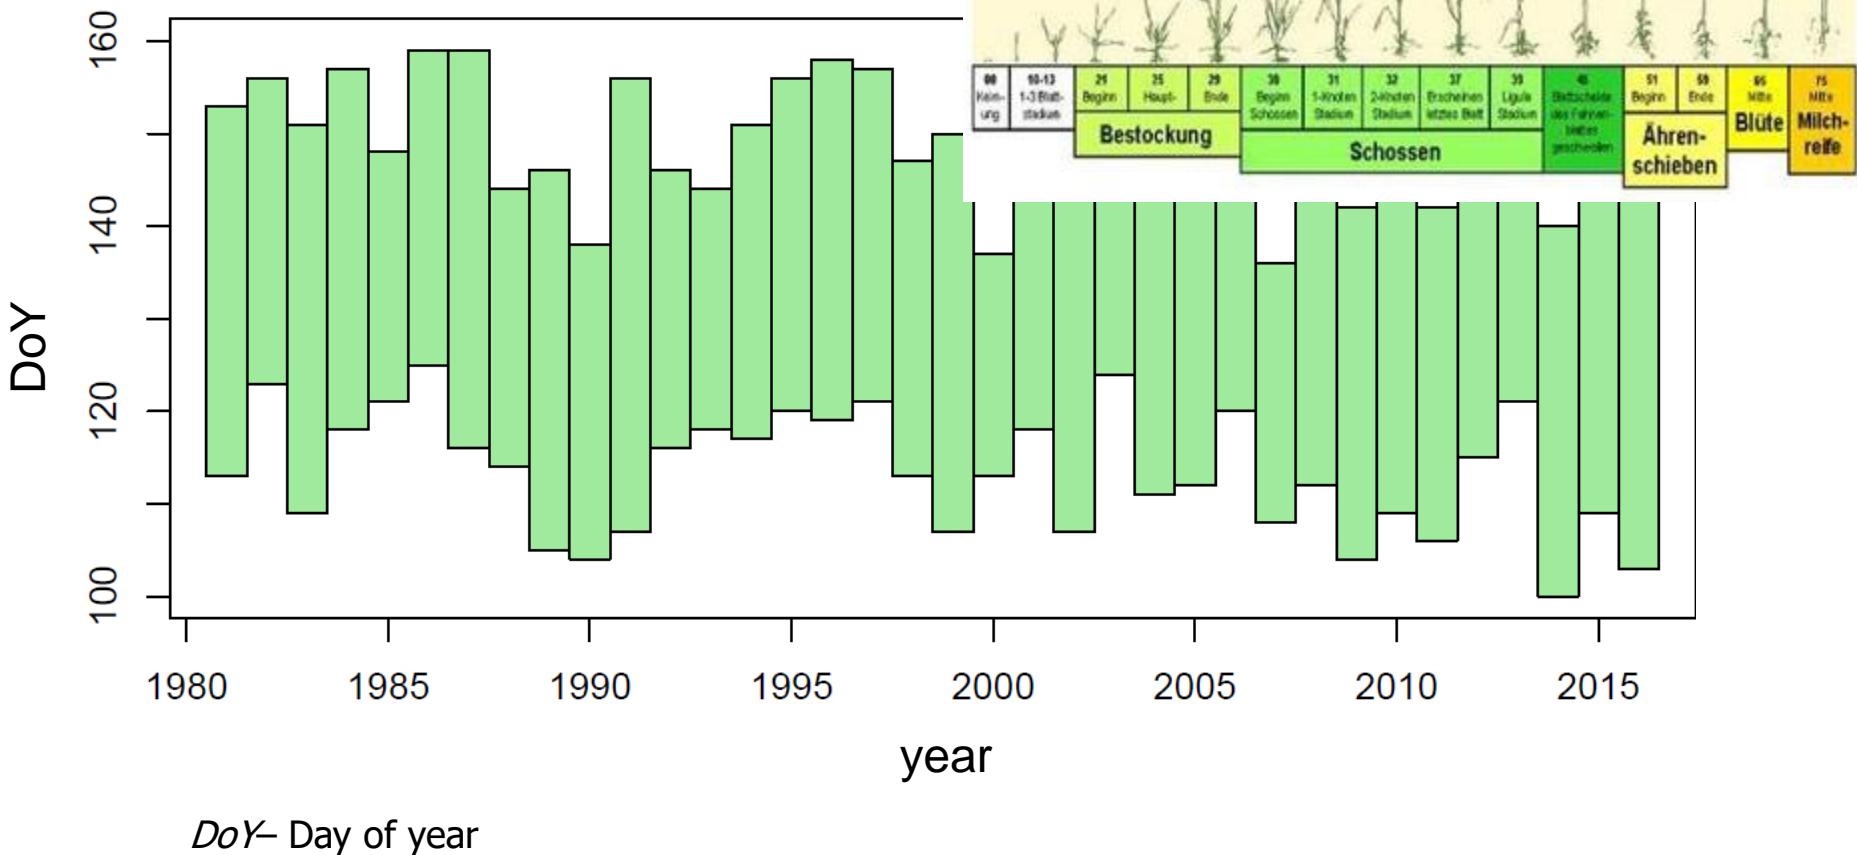

*RU* – Raster unit (f.e.: field, farm, county) | *DoY*– Day of Year |

*P* - Precipitation | *Y*– Year | DEM – digital elevation model

# Decision Support Tool

## Phenologic phase-specific dynamic indice

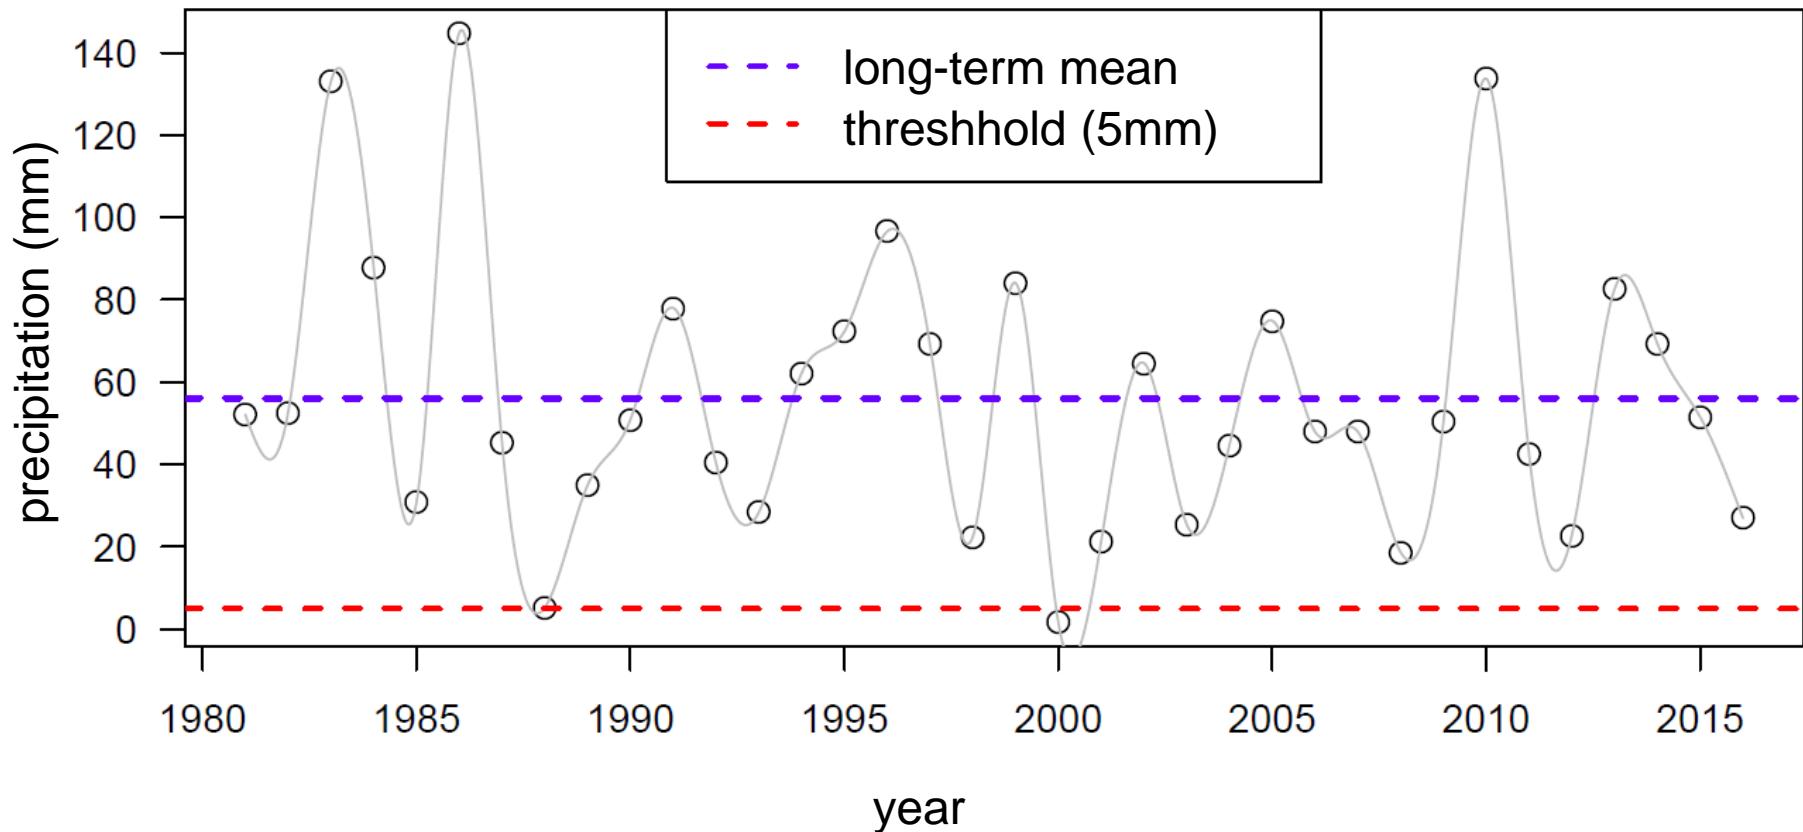

Beginning and end of the winter wheat phenol in the county *Uckermark*

# Decision Support Tool

## Phenologic phase-specific dynamic indices

Time series of phenological phase-specific sums of precipitation for the county *Uckermark* between 1981 and 2016

# Conclusion and Outlook

## Conclusions

- High risk of loss due to weather extremes
- Lack of data to assess extreme weather risks and damage
- Relevance of extreme weather events depends on crop, location, phenologic phase
  - Decision support tools for practitioners have to factor that in

## Ongoing work and next steps

- Implementing the monitoring tools
- Implementing the interactive information exchange → linking of geodata
- Development of analysis routines to provide field-specific decision support
- Testing the webtool and app with agricultural consultants and test farms
- Concept for continuation of EMRA
